Reasons For Allowance

The present invention is an atmospheric combustion turbine system. Such systems supply ambient air rather than compressed air to the turbine's combustor, and they create a pressure drop across the turbine by placing a compressor downstream of the turbine. While uncommon, arrangements of this type are in fact known in the gas turbine field as shown, for example, by the three references listed on the attached Form PTO-892. None of the references of record however disclose or fairly suggest such a system comprising the claimed combination of features including: a combustor and turbine followed by a compressor, a cooler at the compressor entrance to cool working gas and produce hot water, a humidifier for producing humidified mixed gas by mixing air with the hot water and part of the compressor exhaust, a regenerator that cools high temperature turbine discharge gas by heat exchange with the humidified mixed gas to produce high temperature humidified mixed gas, and wherein, the high temperature humidified mixed gas is then supplied to the system's combustor in the manner claimed. The claimed invention is therefor considered patentable over the prior art.
